

Stewardship

Mines Management, Inc. and its employees take seriously the notion of good stewardship toward the stakeholders in the vicinity of the Montanore Project.

COMMUNITY

We are driven by, and excited about, the prospect of contributing to improvement of the community's employment base, and are committed to being a responsible 'good-neighbor' in the region. We are also acutely aware of the need to conduct business activities and outreach in ways that are productive for the long term, and in ways that build a strong foundation and long term value in the region that is sustainable.

We believe the example we have set is reflected in the strong support we have enjoyed for development of the project thus far.

State of the art water treatment protects the quality of the water in the region.

Mines Management is actively engaged in promoting responsible and sustainable initiatives in the community.

ENVIRONMENT

The major elements of the Montanore Project are inherently conducive to protecting the environment.

STATE OF THE ART WATER TREATMENT

The Company has invested heavily over the past two years both financially and operationally at the site to protect the quality of the regional water supply.

Water treatment technology used at the Montanore Project is designed to minimize risks of effluent degrading regional surface or ground water.

Completion of second phase construction of the water treatment facility will bring the total initial cost of the plant to nearly \$3 million.

UNDERGROUND MINING REDUCES IMPACT

The Montanore is unique in today's world of large, bulk mined, open-pit projects by being proposed as an underground mine, eliminating the major surface impacts of most mining activities.
